Lab 11 Hometask

**SECTION:**

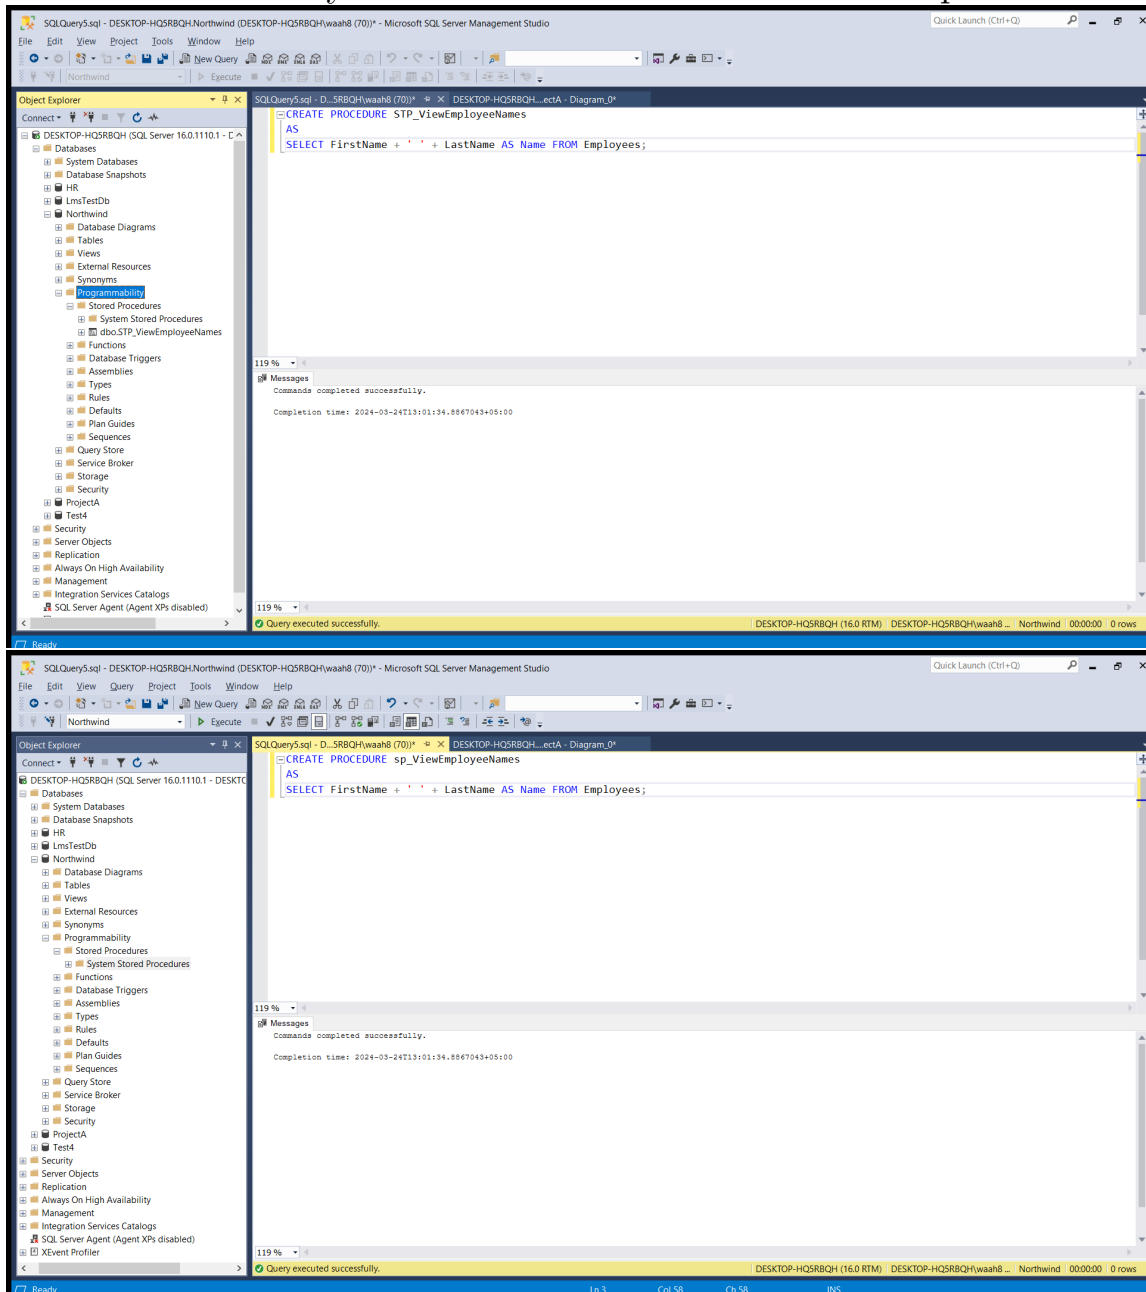

A

In this report, I have displayed how you can create and use stored procedures for an optimized usage in your database:

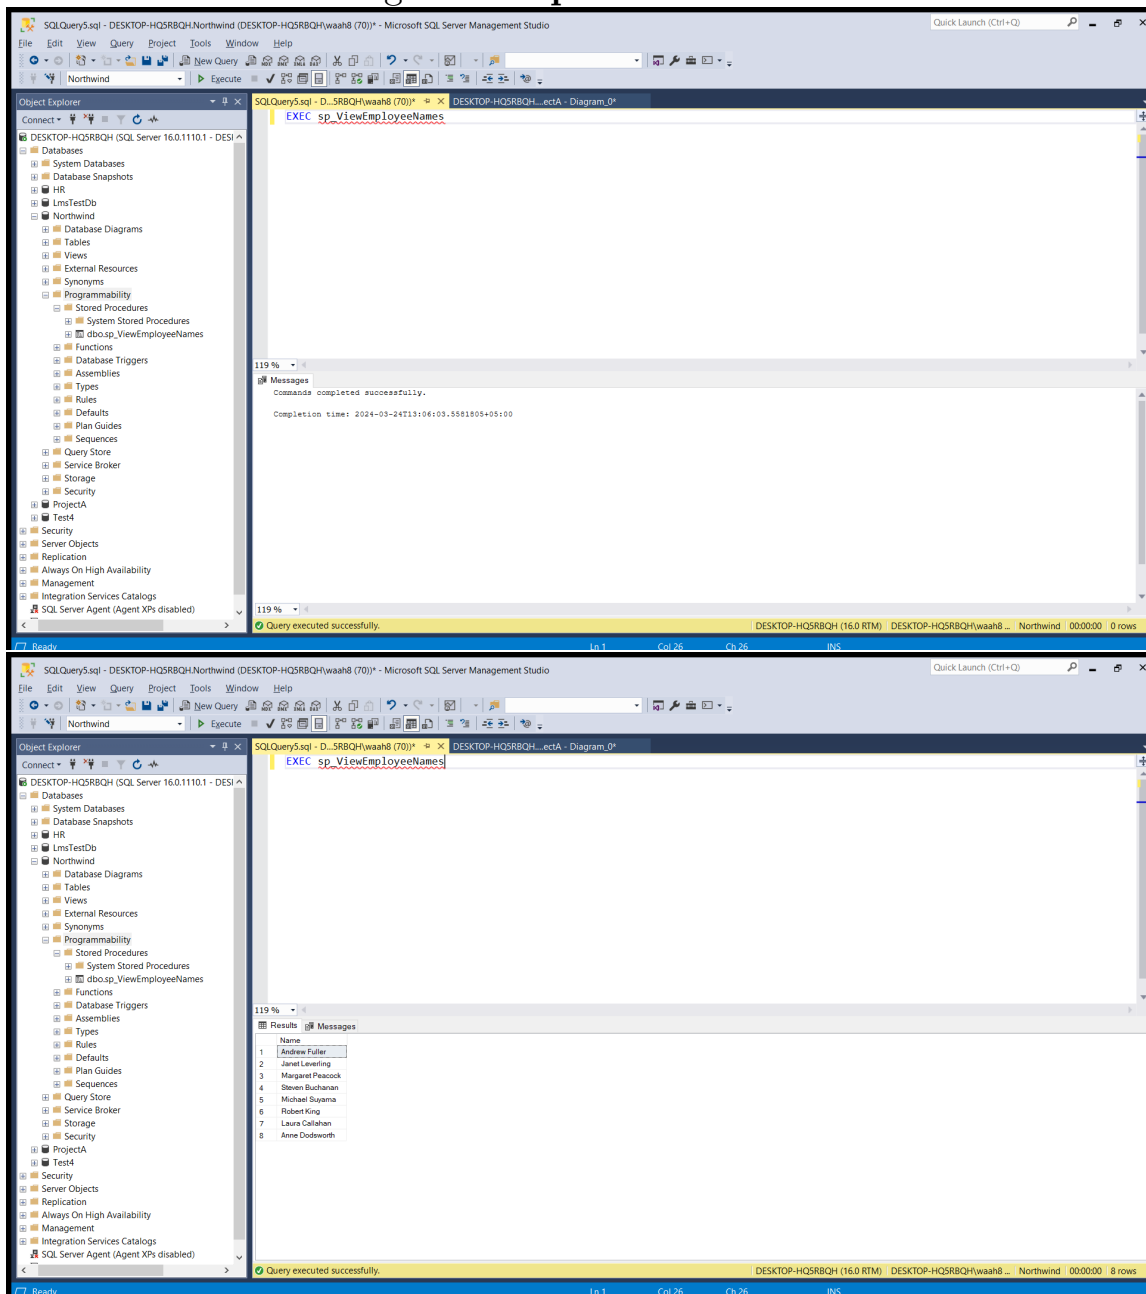

As you can see, currently there isn't any stored procedure currently present in the stored procedure directory. You can create a stored procedure using **CREATE storedprocedurename AS SQL Query**

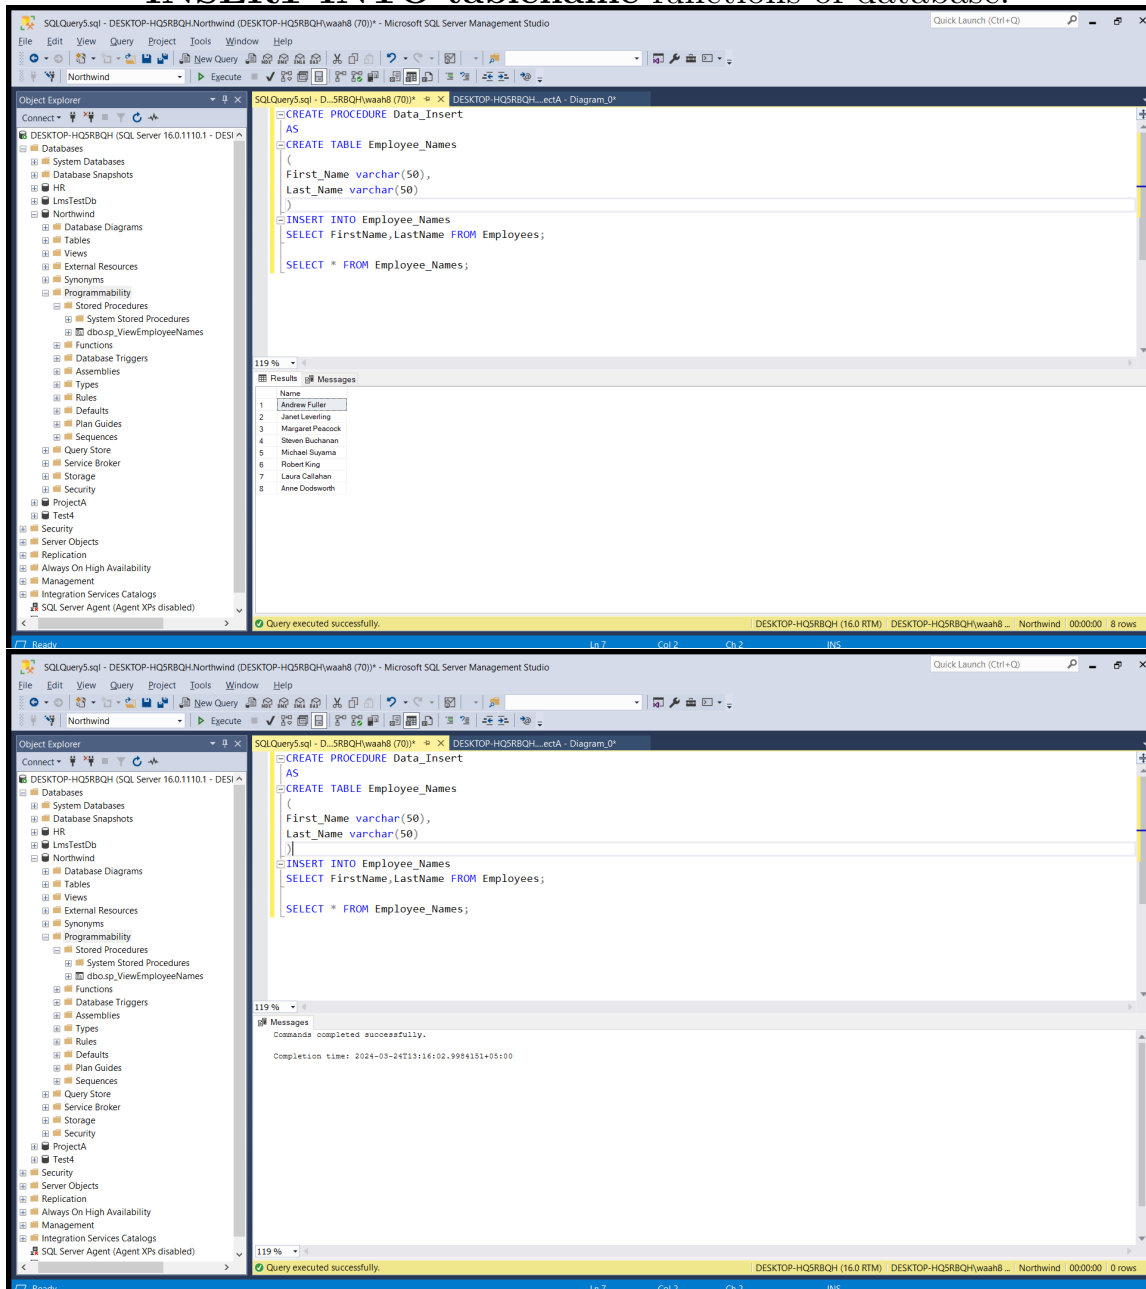

After I execute the written query you may need to refresh the database directory in order to view the created stored procedure.

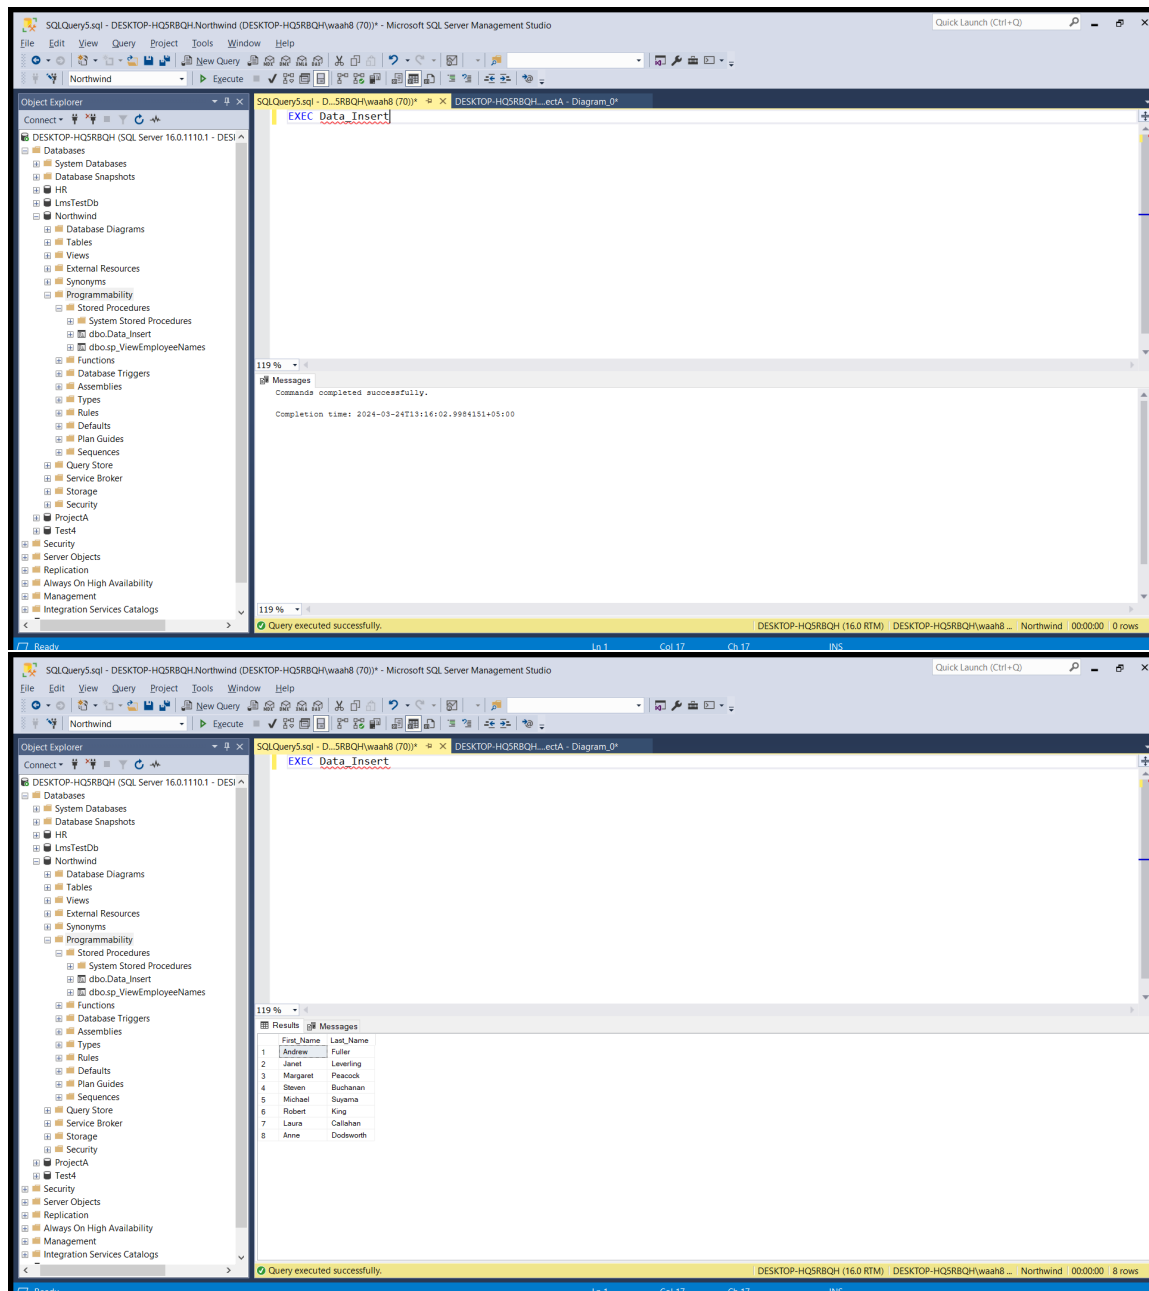

Now after successfully creating a stored procedure we can use it by using **EXEC** procedurename

You can also use stored procedures to create certain table as per desired by the database requirements by using **CREATE OR INSERT INTO tablename** functions of database.

There is also another method to create a stored procedure that can only be accessed if it is only given the required parameters as specified in the stored query. A parametered stored query can be created by using **CREATE OR ALTER StoredProcedureName @Parameter**. The specified parameter may or may not be used in the query inside stored procedure.

It is important to note that a parametered stored procedure will not execute if the parameter is not passed.
